

ABSTRACT OF THE DISCLOSURE

According to the wireless display system of the invention, by wireless communication of display data of plural personal computers to one wireless display, and divided simultaneous display, plural personal computers can be always monitored simultaneously, and moreover can be operated individually by using one wireless display. Therefore, the supervisor can monitor and operate plural personal computers simultaneously without moving around, so that the problems of physical burden of supervisor, lowering of quality of working and learning, and tremendous cost of installation and maintenance can be solved at the same time.
